Icing Protection  
by steep

“ The antennas with the steep De-Icing System have stopped failing, we do not have to worry about these sites anymore!

# steep De-Icing-System

## The steep De-Icing System is the solution to frosted directional antennas

The steep De-Icing system was developed by the company's in-house department for special developments for iced directional antennas. It offers icing protection for antennas with a circumference of up to 3 metres. It is characterized by its reliability and longevity without changing the characteristics of the antenna. A further development was carried out in cooperation with numerous national and international network operators.

### Features:

- The steep De-Icing System is available and employed for antennas with a diameter of 0.3 m to 3.0 m.
- The power supply is ensured by a 230 Volt connection per heating circuit.
- Depending on the size of the antenna, one to three heating circuits are used.
